Your discussion: <p style="margin-top: 10px;"> <i>I assigned a different feature # to this layer because it looked like trench cut (29,852 = (29,854) cut THIS layer, for which I could see an upper boundary or surface, and that (28,947) went over top of cut (29,852). But it is some kind of deposit - silt from erosion of KKT duns and scattered limestone frags. from erosion of Central Field East tanks and bedrock surfaces mixing w/ wind-blown sand tinting it brown, filling slope down to E-SE.</i> </p>
