Description:

SU 5103 likely represents a natural fill below the plow zone. Artifact densities dropped ^{off} significantly. No cobble sized stones or larger for that matter, were encountered while excavating this SU. The Unit was closed when we reached sediments that were slightly less ^{compact} and we began uncovering more gravel sized stones as well as a few cobbles. I anticipate that we will reach cultural deposits in the SU. The level measured approx 12 cm. thick.
