Date (dd/mm/yy): 16/06/08 EU: 2 SU: 5244

Description: The SU has very loose, stony soil that continues down to the level of bedrock in 5217. The SU was closed arbitrarily because it is 720cm deep and has reached the beginning of the first substantial dip in the bedrock. Of note is the high concentration of diagnostic shreds in the NW corner of the SU, including several handles of various sizes (5cm diameter to 1cm). Also there are many sandstone chips, possibly related to the large sandstone block to the S. The block apparently continues - in the next SU I expect to begin excavating the cistern and tunnel from SU 5217 and 5224.
