SU: 5705

Description: The SU is located between the north and south walls. It has pockets of mudbrick-like sediment and some small yellowish sandy deposits. Artifact density is fairly low, much lower than 5702 which was directly above 5705. Very rocky soil with medium-sized rocks. It is possible it is tumble from either wall. The soil is almost uniformly compact. Some rocks appear at the west end of the trench in the middle and at the east edge of the trench just north of the southern wall. Both of these rock groupings look random so far and could be large tumble rocks. Animal and plant disturbances change soil color/compactness slightly in small pockets. Soft white material found just south of the north wall. The soft material does not appear much outside of this pocket. Many large fist-sized stones appear scattered in the SU. They are located mainly in the south-end but not entirely
