*summary:*

**Opened:** We saw in the baulk after the cleaning of the traktor the face of this wall

**Limits (N)** baulk

(S) L04G-006

(E) excavated in the past

(W) can not be seen

**Closed:** end of season

**Matrix:** This wall contains only two rows of stones. the lower one made of large stones 30-40 cm and on top of it smaller stones (10-20 cm) which do not cover the entire area of the wall.

**Relations:** We found the southern face of this wall when the traktor clean the large stone which fell into our area. we can not see to which other wall its connect. Its direction is East West.

As mentioned before we found only two rows of stones and the width of it was probably also made of two lines of stones. But we could see it only in the eastern edge of the wall (with one large stone and total width of 0.7 m) the rest of it is still covered under later walls (W9041) The western end of it is also unknown and covered with unexcavated material. The bottom of wall is higher and most probably later than Sloan's floor which was excavated to the south of it. This was determined according to the limited area of excavation which we had to the south of the wall. This area was in the baulk and loci L04G-006 and L04G-011 covers it. We saw the continuation of Sloan's floor with some vessels in situ, including a jar half embeded into the white layer floor. In the section it was quite obvious that the floor is below the wall and some of the shards which was on top of it are still in the section and can not be taking out.

**Importance:** probably phase 5 wall
