Summary

Opened: Opened to begin season and continue excavation of multiple floors of L9932

Limits (N) L18000
(S) Debris below W9278 and W9425
(E) E Balk
(W) L9944

Closed: L18006 and L18000 both came down on patchy F18000. F18000 was the last of the multiple surfaces begun in L9932, L18030 opened below L18000 and L18006

Matrix: The soil was a consistent reddish brown, lightly packed to firm it contained a concentrated amount of shell and bone. An even and strong distribution of pottery sherds were also excavated. The matrix of L9944 and L9948 corresponds only in soil color.

Relations: L18006 is a downward continuation of the patches and resurfacing of F9932. To the North L18006 continues into L18000. The only difference in loci is that more floor material of F9932 was initially visible in L18000 than in L18006. To the South L18006 comes into the debris below W9278 and W9425 and the gap between. To the East L18006 continues into the balk. To the West L18006 continues into L9948. Pit 18022 cuts L18006.

F18006 was patchy and represents the original floor. It is the same as F18000 to the north and the floor that L18000 and L18006 came down on is collectively called F18000. In the south F18000 continues into the debris below W9278. On the East F18000 probably continues into the balk. On the West F18000 continues as F9932b and probably as F9944. In the South and West balks a continuous floor was clearly defined. The high point in the West balk was F9932 while in the south balk the lowest part was F18000.

L18006 covers but does not seal L18030 below. F18006 was too poorly preserved to seal L18030 below

Note: see note on card for L18000
 Additional photo = 117:316

Additional Observations/Value: The value of L18006 is questionable as the quantity and quality of the material is not impressive
