Unit	Phase	Stage	Stratum	PoM
------	-------	-------	---------	-----

Summary

Opened: Reached 1989 season elevations, and came down onto six distinctly different areas of material; opened L9622, L9623, L9624, L9625, W9626, & L9640

Limits (N) Bordered by L9625 & L9622

(S) Bounded by L9623

(E) Bounded by L9623

(W) Bordered by L9539

Closed: Came down onto floor F9623 in L9623, L9624, & L9625

Matrix: Dark mudbrick-debris material, with little pottery

Relations: L9600 covers but does not seal, L9624. To the N, the relation between L9624 and L9625 is not clear. L9625 consists of mudbrick debris, crumbly grey soil, and a few cobble stones that may have fallen from W9626. The floor beneath L9625 is lower than that of L9624 (ca. 14.11 - 14.19). Perhaps the material of L9624 reaches that of L9625. To the SSE, L9623 probably reaches L9624 since the mudbrick debris of L9624 was deposited directly on top of the floor with no fill in between. For this reason, L9623 may be later. Also to the E, pit L9622 cuts L9624. To the W, L9624 is probably cut by pit L9539. Although material of L9623, L9624, and L9625 is different for each locus, the same floor F9623 underlies each one of them. F9623 covers and seals L9661.

In the N part of A131, there is a fragmentary floor, F9606/9063?, at about the same level as F9623.

Additional Observations/Value: Because L9624 lies below a "cleaning" locus, it may be disturbed.
