Summary

Opened: When the cleaning locus ^{L9605} came down to the cobble floor of L9044, the area below the cobbles became 9628 and the unsealed area became 9627.

Limits (N) L9621
 (S) L9628
 (E) L9621 and W9047.
 (W) Material below L9025.

Closed: When the fragmentary remains of floor L9627 were reached.

Matrix: The red soil was almost clean until we reached a row of undressed field stones, the top of W9636. Some carbon flecks in the soil to the south, burnt material were above the fragmentary kurkar floor. The fill in 9627 is the same as the fill below of 9621 and 9628.

Relations: L9627 covers ^{and seals} W9636 and L9635. L9047 floats above ^{the level of} L9627. The locus below L9047, fill L9641 could be continuation of L9627; it is also mudbrick debris. The fill of L9627 probably continues under the drain L9025. The kurkar floor of 9627 reaches the top north course of W9636 and extends over the southern lower part. L9627, L9621 and L9628 are probably continuous being the fill below cobble floors in 9628 and 9621 and the fill below cobbleless area of 9627. The floor of 9627 is almost certainly contemporary with the floor of 9635, north of W9636. They likely represent different floor levels in the same building.

Additional Observations/Value: The least contaminated iron 2c pottery came from below this locus. Possibly a sealed deposit.
