Unit	Phase	Stage	Stratum	PoM
------	-------	-------	---------	-----

Summary

Opened: When rubble material in loose fill in E end of [L9511] changed to a rocky layer of Karkar with few sherds.

- Limits (N)** Bounded by [W9510] to the North.
(S) Bounded by [L9512] to the South ('89 season).
(E) Bounded by [L9633] to the East.
(W) Bounded by [L9645] to the West.

Closed: Came down on grey, ashy pit material of [L9655] in the E. portion of the locus and fallen mudbrick material of [L9662] in the West.

Matrix: Rocky, orange Karkar soil with few sherds, as compared with the darker, brown fallen mudbrick material of [L9662], the looser fill of [L9511] and [L9645], and the pit material of [L9655].

Relations: [L9644] is covered and probably cut a little by [L9511] (the robber trench of [W9510] or the robber trench of the robber trench of [W9510]). [L9644] covers part of [L9662] and cuts and covers part of [L9655]. [L9644] also cuts [L9633]. [L9644] is reached by the material of cleaning locus [L9603]. The relationship of [L9644] with [L9512] is unclear because [L9512] was excavated 2 years previously, but most likely [L9644] and its associated wall [W9510] cut the "compact, red-brown soil with fist sized Karkar chunks, few sherds or shells" of [L9512], which sounds like a description for fallen mudbrick wall material. [L9644] is the foundation trench of [W9510] and reaches the southern most stone of [W9510]. The material of [L9644] can be seen to extend beneath [W9510] in section beneath [W9510].

Additional Observations/Value: Foundation trench of large pier and ashlar wall (W9510) that cuts and covers part of a large Persian pit.
