Unit	Phase	Stage	Stratum	PoM
------	-------	-------	---------	-----

Summary

Opened: When it was determined that horizontal twilight zone [L9861] above was no longer potentially disturbed. A technical change to stratified accumulation was made.

Limits (N) Bounded by the unexcavated material below [W9216] and [W9085] to the North.

(S) Bounded by [W9211] to the South.

(E) Bounded by [L9186] to the East.

(W) Bounded by [W9408] to the West.

Closed: Collapsed with material of similar matrix below [L9186] to the East to form [L9903].

Matrix: Sandy orange/brown mudbrick material with many sherds, bones, few Kurkar fieldstones, some bits of disassociated reed matting and shells in East half of Locus. Some ashy deposits throughout, becoming less frequent with depth.

Relations: [L9881] is covered by [L9861], of which it is the continuation. [L9881] covers the western two-thirds of [L9903] below, which is also the continuation of the matrix of [L9881]. [L9881] reaches the unexcavated material below [W9216] and [W9085], which is the continuation of the matrix of [L9881]. [L9881] is cut by [L9186]. [L9881] reaches the plaster face of the eastern side of [W9408].

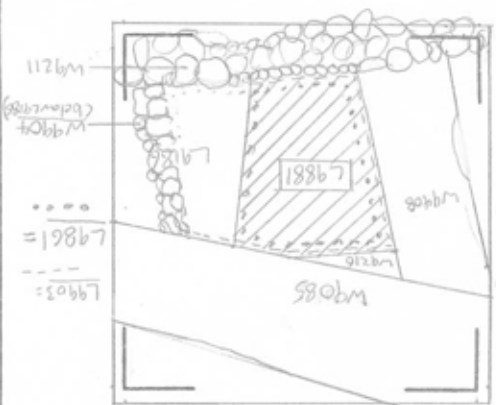

It appears that [L9881] reaches [W9211], although we cannot be sure of this relationship until the relationship of any possible floors in the loci below [L9881] to [W9211] can be determined. [L9881] does not relate to [W9904] at all directly, but the fill below ([L9903]), which is the continuation of the matrix of [L9881], reaches [W9904].

Additional Observations/Value: Soil Sealed Iron F fill with many sherds reaching phase 6/7 walls. High Value.
