Unit	Phase	Stage	Stratum	PoM
-------------	--------------	--------------	----------------	------------

Summary

Opened: When several areas of pure mudbrick debris were noticed at the base of L9895.

Limits (N) L9956
(S) Bulk of AI31, and the Wmost extent of W9715 in the SE.
(E) L9933 to the N, L9913 to the S.
(W) Pedestal underneath L9025, the Roman drain feature.

Closed: When S edge of W9963 and Wedge of W9964 were defined

Matrix: Continuation of fieldstone rubble debris of L9895. Field stones ranging in size from fist size to 40x40x20cm, in a matrix of mudbrick debris. Sherd density is low, but still higher than in adjacent loci of pure mudbrick debris (L9956, L9933, and L9913), which contain no inclusions.

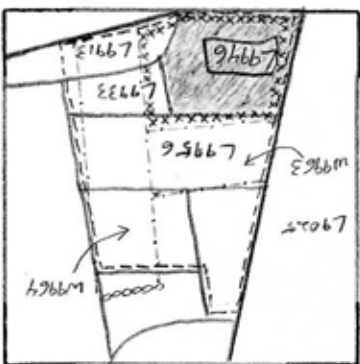

Relations: L9946 is a continuation of the matrix of L9895 above. To the N and E, L9946 reaches three loci composed of pure mudbrick debris - L9956 to the N, L9933 to the NE, and L9913 to the SE. L9946 covers, and seals, L9979 below.

Additional Observations/Value: This locus only has value for stratigraphic analysis in that it is a continuation of L9895, the field stone wall collapse.
